

RESET

How it works

The rules behind the booking system, in plain English

Written for the people who run the shop, not for developers. It explains why the system behaves the way it does — why some times appear and others do not, what happens to the money, and what each button in the admin panel actually changes.

RESET, Sadashiv Peth, Pune · Prepared September 2026

Describes the system as configured today. Where a number can be changed in the admin panel, the page says so.

THE ONE THING TO REMEMBER

Booking a slot and paying for it are two separate events. A customer books and the slot is theirs — but no money has moved. Staff take payment at the counter and mark it paid, and only then does the customer's entry code appear. Most of the behaviour that looks surprising follows from this one fact.

1 • The shop in one page

What exists, and what each part is for.

Thing	What it means
Service	A treatment you sell. Has a name, a price and a length. <i>Head, ₹49, 10 minutes.</i>
Station	A bed or chair. One customer at a time. You have three.
Slot	A start time offered to a customer. Generated, never stored — the system works it out fresh each time someone looks.
Booking	A customer holding a slot on a station. Exists whether or not it has been paid for.
Add-on	An extra chosen while booking. Changes both the price <i>and</i> the length.
Order	A product bought from the shelf, collected at the counter.

What is set up today

Treatment	Price	Length
Head	₹49	10 min
Head + Neck + Shoulder	₹99	15 min
Head + Neck + Shoulder + Back	₹149	20 min
Basic	₹199	20 min
Premium	₹299	30 min

Setting	Today
Opening hours	Tuesday to Sunday, 09:00–21:00. Closed Mondays.
How far ahead people can book	7 days
Free cancellation until	2 hours before the slot
Gap left between bookings	5 minutes
Online payment	Off — everything is settled at the counter

2 · Stations — the real limit on how much you can sell

A station is a bed or a chair. It serves one person at a time. Everything the system refuses, it refuses because a station was not free.

Three stations means three customers at once

Not three bookings a day — three *at the same moment*. At 14:00 you can have three people being treated. The fourth person asking for 14:00 is refused, and that refusal is correct.

A station can be limited to certain treatments

Some beds suit some treatments and not others — space, equipment, whatever the reason. You can say so, and the system respects it when working out what to offer.

IN THE ADMIN PANEL

- 1 Open **Capacity** → **Stations**.
- 2 The **Can perform** column shows what each station is set up for — either "Every service", or the treatments named.
- 3 Press **Change services** on the row you want.
- 4 Either leave it able to do everything, or tick only the treatments that station can take.

How this is set up today

Station	Can perform
Station 1	Every treatment
Station 2	Every treatment
Station 3	Head, and Head + Neck + Shoulder only

WHAT THIS DOES TO YOUR CAPACITY

You do not have three of everything. You have **three** stations for a Head massage, and only **two** for Premium — because Station 3 cannot perform it. So three customers can book Head at 14:00, but only two can book Premium at 14:00. The third is told the time is unavailable, and that is right.

THE TRAP

If you restrict a station and tick *nothing*, that station can never be booked at all. It quietly stops earning. The panel shows "**Nothing — nobody can book this station**" in red when this happens. Similarly, a treatment no station can perform will appear in the app and then offer no times whatsoever — the Catalog screen warns you about that too.

3 · Time — why those times and not others

Slots are not a fixed timetable. They are worked out fresh every time somebody looks at the app, from what is genuinely free right now.

The starting grid

Times are offered every **5 minutes** — 09:00, 09:05, 09:10 and so on. That is the "granularity" setting. Because your treatments are 10, 15, 20 and 30 minutes long, in practice you see clean times.

Then four things remove times from that grid

- 1 **The shop must be open.** A time outside 09:00–21:00 is not offered, and Mondays offer nothing at all.
- 2 **The treatment must finish before closing.** A 30-minute Premium cannot start at 20:45, because it would run to 21:15. Head can start at 20:45 — it finishes at 20:55.
- 3 **A station must be free for the whole length.** Not just at the start — for every minute of it, plus the gap afterwards.
- 4 **The time must be in the future,** and within the next 7 days.

WORKED EXAMPLE — WHY 09:00, 09:30, 10:00 FOR A 30-MINUTE TREATMENT

Premium takes 30 minutes and you leave a 5-minute gap after each booking. Somebody books 09:00. That station is now busy 09:00–09:30, and unavailable until 09:35. The next Premium on *that* station can start at 09:35 — but 09:30 is still offered to customers, because a **different station** is free. This is why times look regular from outside while the actual bookings are staggered.

The 5-minute gap between bookings

After every booking the station is held for a further 5 minutes — wiping down, the customer getting up, the next one settling. It is invisible to customers and it is why a 10-minute treatment actually occupies 15 minutes of a station.

Change it under Capacity → Booking settings → buffer between bookings.

Add-ons make the treatment longer

An add-on that adds 15 minutes makes the booking 15 minutes longer, and the station is held for that whole time. Two customers choosing the same treatment can therefore occupy different amounts of the day.

WHY THE SAME TIME CAN DISAPPEAR BETWEEN LOOKING AND BOOKING

Availability is worked out at the moment you ask. If somebody else books the last free station while a customer is deciding, the time is genuinely gone. The app says so and sends them back to pick another. Nothing is wrong — two people wanted the same bed.

4 · Which station gets the booking, and why it matters

The customer never picks a station. The system does, and it does not pick at random — a careless choice costs you money later in the day.

Rule one — the most restricted station goes first

If a station can only perform Head, it takes the Head booking. The general-purpose stations are left free for the treatments only they can do.

WHY THIS EARNS YOU MONEY

Suppose a Head booking came in and the system put it on Station 1, which can do everything. A Premium request arrives for the same time. Station 1 is busy, Station 3 cannot do Premium — you have lost a ₹299 sale to protect a ₹49 one. Putting the Head on Station 3 in the first place keeps the expensive treatment sellable.

Rule two — fill the small gaps first

Where several stations could take a booking, the system chooses the one where it leaves the least wasted time. It slots a 10-minute treatment into an existing 15-minute hole rather than opening up a clean, empty station.

A new Head booking goes into the *gap* on Station 3, not onto the empty Station 2. Station 2 stays clear, so a Premium can still be sold that morning. Without this, a run of short bookings scattered across empty beds chops the day into ten-minute holes and no long treatment fits anywhere.

WHERE TO SEE IT

Timeline shows the day station by station, updating every 30 seconds. This is the screen to keep open at the counter — it is the only place the real shape of the day is visible.

5 · Clashes — the three different "no"s

A customer can be refused for three quite different reasons. They look similar and mean very different things, so the system words them differently on purpose.

What happened	What the customer sees	What to tell them
Somebody else got it All eligible stations are busy at that time.	"That time has just been taken. Pick another and we will hold it for you."	Genuinely gone. Offer the nearest free time.
It clashes with their own booking They already have something overlapping.	Names their own treatment and its booking code — "Premium overlaps this time (RST-2K8F4M). Cancel it first, or pick another time."	They are double-booking themselves. Check their Visits.
No station can do it at all The treatment is not assigned to any station.	The treatment appears, then offers no times on any day.	This is a setup mistake, not a busy shop. Fix it in Capacity.

TELLING THEM APART MATTERS

The second one used to say "that time has just been taken", which blames a stranger for the customer's own appointment and sends them hunting for a problem that is not there. It now names their own booking. If you ever see the generic message where the customer insists nobody else is booked, check whether the treatment has any station at all.

Two people pressing Book at the same instant

Only one can win, and the database enforces it — not the app. The second person is refused cleanly and sent back to choose again. The same bed can never be sold twice, even if both taps land in the same millisecond.

6 · Money — booking is not payment

There is no online payment. This is a deliberate choice and it shapes everything that follows.

What happens when a customer books

- 1 They pick a treatment and a time.
- 2 They sign in. The system needs to know who they are before it will hold a slot.
- 3 If the shop has no phone number for them, it asks for one. **A booking cannot be made without a number** — you have no way to ring them otherwise.
- 4 They press Book. Now the booking is made. Nothing before this point books anything.
- 5 The slot is theirs. **No money has moved.**
- 6 They see "Awaiting confirmation" and **no entry code.**

What happens at the counter

- 1 You open **Payments due**. Every unpaid booking is listed with the amount and a tappable phone number.
- 2 You take the money — cash, UPI, card, whatever.
- 3 You press **Mark paid**.
- 4 The customer's entry code appears in their app, and the booking counts towards the day's takings.

WHY THERE IS NO QR CODE BEFORE PAYMENT

The entry code is proof of a paid booking. Issuing it before the money arrives would let anybody book a free treatment from their sofa and walk in with a valid code. So the code does not exist until payment is recorded. **A booking showing no QR is working correctly** — it is waiting for you.

YOU CANNOT SERVE AN UNPAID BOOKING

The system refuses to check in, start or complete a booking that has not been paid for. Both the scanner and the status dropdown refuse it. This is deliberate: without it, a member of staff can hand over a free treatment with two taps and nothing anywhere records that it happened.

Marking a no-show or cancelling is still allowed on an unpaid booking — those are exactly what an unpaid booking usually turns into.

Pressing Mark paid twice

Safe. The second press tells you it was already paid and does not double the day's takings. A busy counter double-taps; the system expects it.

WHY NOT JUST TAKE CARD PAYMENTS ONLINE?

It can be switched on when the client's payment account is live. Nothing in this document changes except that money moves at step 4 instead of at the counter, and the entry code appears immediately.

The system was built for both.

7 • The day at the counter

The four screens staff actually live in, and what each is for.

Screen	Use it for
Today	A glance at the day — how many bookings, how much taken.
Timeline	The day station by station. Keep this open. Refreshes itself every 30 seconds.
Check in	Scan the customer's code, or type it, when they arrive.
Payments due	Money not yet collected — bookings and shop orders, with phone numbers to ring.

The life of one booking

State	Means	Who sets it
Confirmed	The slot is theirs. Not yet paid for.	Automatic when they book
Paid	Money collected. Entry code issued.	You, on Payments due
Checked in	They have arrived.	You, on Check in
In progress	Being treated.	You
Completed	Finished.	You
No show	Booked, never arrived.	You
Cancelled	Called off. The slot goes back on sale.	Customer or you

YOU CANNOT COMPLETE A BOOKING BEFORE IT STARTS

Checking somebody in early is fine — people arrive early. But marking a booking *completed* before its start time is refused, because a treatment cannot finish before it begins. Doing it used to make the booking vanish from the customer's app altogether.

8 · Cancellations, no-shows and deleted accounts

The customer cancels

Free up to **2 hours** before the slot. After that the option disappears — the bed was held and the time cannot be resold at short notice. The slot goes back on sale the instant they cancel.

Change the window under Capacity → Booking settings.

You cancel

From Payments due or the booking itself. The system asks first — freeing somebody's slot should never be one mis-tap away. **The customer is not told automatically.** Ring them.

They do not turn up

Mark it **No show**. This works on an unpaid booking. It is recorded against the customer, and repeat no-shows are visible on their record — useful when deciding whether to keep taking their bookings.

They delete their account

Their name, number and contact details are erased. **Every upcoming booking is cancelled**, freeing those slots. Records of past payments are kept for tax, with the person no longer attached to them.

WHY THIS MATTERS

Deleted accounts used to leave their bookings behind, holding stations for treatments nobody would ever attend. The shop looked full when it was not, and customers were told "only 1 seat left" for times that were completely free.

9 · The shop shelf

Products bought in the app and collected at the counter. It works like bookings, and for the same reason.

What happens

- 1 The customer adds products to a basket and places the order.
- 2 **The stock comes off the shelf immediately** — the moment the order is placed, not when it is paid for. Otherwise two people could buy the last one.
- 3 The order is **unpaid**. The customer sees "Pay at the store".
- 4 They come in, you take the money, and press **Mark paid**.
- 5 You press **Mark ready** when it is bagged. That sends them a notification.
- 6 They collect. You press **Collected**.

IN THE ADMIN PANEL

Products → **Orders**, filtered to **Unpaid**. Unpaid orders also appear on **Payments due** alongside the bookings, with the number to ring.

CANCEL ORDERS NOBODY COLLECTS

An unpaid order holds its stock indefinitely. If somebody orders and never comes in, that product is off the shelf until you cancel the order — which puts the stock straight back. Check the Unpaid list regularly.

An order cannot be marked ready before it is paid for, for the same reason a booking cannot be served unpaid.

10 · Rewards, streaks and scratch cards

Three separate mechanisms. They can run at once, and they do different jobs.

Streaks — rewarding people who come back

A streak rule says: *come this many times within this many days, and get this*. For example, five visits within 30 days earns 20% off.

- Only **completed visits** count. A booking that was cancelled or never turned up does not.
- The clock is a rolling window. If the window passes without reaching the target, the count starts again from one.
- When they hit the target, the reward lands in their wallet and the count resets to zero, so they can earn it again.

Rewards → Streak rules.

Scratch cards — a prize draw

A campaign issues a scratch card on a trigger — every check-in, or a particular booking number. The card holds several possible prizes, each with a **weight**.

HOW WEIGHT WORKS

Weight is relative, not a percentage. A prize weighted 1 against one weighted 9 is drawn one time in ten. The dialog shows you the real chance of each prize as you type, so you do not have to work it out.

Each prize can have a **stock limit** — "only 10 of these ever". When it runs out it stops being drawn. If everything runs out, the card is returned unscratched rather than burned, and the customer keeps it.

The **Figures** button on each campaign shows what it has cost and what it has produced — the number to look at before deciding whether to keep it running.

Manual grants — the "sorry about the wait" lever

You can give any customer a reward directly. Every grant is recorded against whoever made it. If one is given by mistake, open the customer under **Customers** and press **Revoke** — it disappears from their wallet.

How a reward is used

The customer applies it while booking, and the price drops. The discount is worked out by the server, never by the app, so it cannot be tampered with. If the booking is cancelled, the reward goes back to their wallet rather than being lost.

11 · Closing the shop, and reserving stations

Closures — holidays and one-off shut days

A closure takes times off the app. It can be the whole shop for a day, or one station for a few hours while a chair is repaired.

IN THE ADMIN PANEL

- 1 Capacity → Closures → Add closure.
- 2 Choose the whole day, or turn that off for a specific window.
- 3 Choose the whole store, or one station.
- 4 Add a reason — for staff, never shown to customers.

EXISTING BOOKINGS WIN

If bookings already fall inside the window, the closure is **refused** and tells you how many are in the way. Nobody is stranded by a decision made after they booked. Move or cancel them first, then close.

Allocation rules — reserving stations for particular treatments

A rule reserves specific stations for specific treatments during a window — or keeps them clear of it. For example: *every weekday morning, Station 2 is for Head massages only.*

IN THE ADMIN PANEL

- 1 Capacity → Allocation rules → Add rule.
- 2 Name it. Choose *Reserve for* or *Keep clear of*.
- 3 Pick the days and the time window, the stations, and the treatments.
- 4 Press **Preview**. This is required, and it is the important step.
- 5 Read what it tells you, then Save.

WHY PREVIEW IS COMPULSORY

Reserving two stations for a morning promotion can silently wipe out all availability for a more expensive treatment — and you would not find out until a customer complained they could not book. Preview shows exactly that before you commit. It is the only place those knock-on effects are visible.

Save stays greyed out until you have previewed. If it looks stuck, the form tells you what it is waiting for.

12 · Settings you can change, and what breaks if you do

Capacity → Booking settings. Small numbers with large consequences.

Setting	Today	What happens if you change it
Gap between bookings	5 min	Larger means fewer bookings a day but a calmer shop. Smaller packs more in with less turnaround time. This is the setting with the most direct effect on daily takings.
Slot granularity	5 min	How finely start times are offered. Larger — say 15 — gives tidier times and fewer of them. Smaller offers more choice and a busier-looking list.
Booking horizon	7 days	How far ahead people can book. Longer fills the diary earlier but commits you further out.
Cancellation window	120 min	How close to the slot a customer may cancel free. Shorter is friendlier; longer protects you from last-minute gaps.
Minimum notice	0 min	How soon from now somebody may book. Zero means they can book a slot starting in five minutes. Raise it if walk-in bookings catch staff out.

CHANGING A PRICE

Bookings already taken keep the price they were made at. A price change never rewrites a booking somebody already holds — it applies from the next booking onwards. Same for the length of a treatment.

DEACTIVATING A TREATMENT OR A STATION

Neither touches bookings already made. Deactivating a station removes it from *future* availability and leaves today's bookings sitting on it — so move them first. A treatment with upcoming bookings cannot be deleted at all; the system tells you how many are in the way.

13 · Glossary

Word	Meaning
Awaiting confirmation	Booked, not yet paid for. Normal. It is waiting for you to take the money.
Entry code / QR	Proof of a paid booking. Does not exist until payment is recorded.
Buffer	The gap held after each booking. 5 minutes today.
Granularity	How finely start times are offered. Every 5 minutes today.
Horizon	How far ahead bookings are allowed. 7 days today.
Segment	The top-level split of the menu — Men, Women. The switcher hides itself when only one is in use.
Station	A bed or chair. One customer at a time.
Closure / blackout	A one-off shut period for the shop or one station.
Allocation rule	A standing reservation of stations for particular treatments during a window.
Streak	Visits within a rolling window, earning a reward at a target.
Weight	How often a scratch prize is drawn, relative to the others.

This describes the system as configured in September 2026. Numbers marked "today" are settings, not fixed rules, and can be changed in the admin panel — the page that describes each one says where.
